

Partition framing and boarding.

Drylining workflow example | Block A / Level 03. This example shows the record structure we can configure in Site Manager Pro. It is not a live client record or an SMP screenshot.

Scope	Partition locations, wall types and agreed framing and boarding stages.
Progress	Work recorded by location and stage against the agreed package.
Quality evidence	Concealed-work photographs and inspection records linked before closure where required.
Claim review	Progress and outstanding inspection actions checked against the agreed claim requirements.

What your team receives

An agreed project structure, pricework and package records, configured inspection forms, user responsibilities, reporting routes and operating guidance.

Pilot and acceptance

A sample package is followed from allocation through progress, evidence and claim review to the agreed report. Open items, owners and acceptance checks are recorded before handover.

After handover

Your team operates the project. Continued support for variations, claims, wage reporting or applications is commissioned separately.

Illustrative information only. The proposal defines the actual scope, deliverables and acceptance checks. Client-appointed teams retain technical acceptance, commercial decisions and payment authority. SMP licences and paid add-ons are separate.
